HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Trauma symptoms inventory scale, return-to-work and atypical Complex Regional Pain Syndrome type 1?

Sir,

We read with a particular interest the paper of Collins et al about the Trauma related neuronal dysfunction Symptoms Inventory (TSI)¹. We think, in addition of the interesting work made by the authors that return-to-work should also be discussed, especially for Complex Regional Pain Syndrome type 1 (CRPS1).

The TSI was developed after a complete literature review. It included a very precise description of the complaints, in order to compare chronic pains syndrome like CRPS1 and fibromyalgia¹. However, authors did not included disability and return-to-work in their scale nor in the evaluation, although the impact of these syndromes on return-to-work known by rehabilitation specialists and occupational physicians.

It is true, considering CRPS1 for instance, that very few studies report its socioeconomic impact²⁻⁸, and there appears to be wide variability in the rate of return to work, from as little as 30%² to as much as 75%^{6,7} or more⁸, with most being based on a small number of patients (20 patients, or fewer for 5 studies). A proportion of return to work of over 50% in 12 to 18th months seemed common, depending on the localisation (upper limb), the cause of CRPS1 (work accident, severe trauma for instance⁶), and in case of comorbidity (alcoholism, medicinal products).

We think then the authors of the TSI are probably right to not include disability and return-to-work in their scale, taking into account the heterogeneity of results associated with very different situations. While it appears most patients with early stages of CRPS1 return to work, these are not necessarily the same patients observed in occupational medicine or rehabilitation units. However, by the example of CRPS1, further validation should necessarily include aspects in the validation procedure. Furthermore, we also could conclude that further studies are necessary to describe the return-to-work among patients with atypical forms of CRPS1.

Acknowledgments

We wish to thank Michel Perrigot and Jacques Ameille for their support.
