HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

MEETING ABSTRACT

Open Access

New insights into HTLV entry

Claudine Pique^{1,2,3*}, Olivier Hermine⁴, Francis W Ruscetti⁵, Kathryn S Jones⁶

From 15th International Conference on Human Retroviruses: HTLV and Related Viruses
Leuven and Gembloux, Belgium. 5-8 June 2011

Insight into the long-lasting mystery of the HTLV-1 entry receptor was provided over the past several years by the independent identification of three molecules required for binding and entry into cells: heparan sulfate proteoglycans (HSPG), the VEGF-165 receptor Neuropilin 1 (NRP-1) and the ubiquitous glucose transporter GLUT1. Further studies have indicated that these three molecules work together to ensure virus binding and ultimately, fusion of the viral and target cell membranes. Interaction of the virus with this receptor complex is mediated by the envelope glycoproteins (Env), which consists of a complex formed between a surface (SU, gp46) and a transmembrane (TM, gp21) subunit. Studies prior to the characterization of the HTLV-1 receptor complex identified domains and specific residues of the HTLV-1 SU involved in the Env/receptor interactions through either characterization of neutralizing antibodies or peptides or analysis of Env mutants. We will present our current model for HTLV-1 entry and revisit the data about the functional domains of the SU in regard to the recently acquired knowledge about the three receptor molecules. We will also discuss the role of these three molecules during the cell-cell and cell-free infection of T cells and dendritic cells. Finally, we will examine the similarities and differences between the distinct members of the HTLV family in their receptor usage.

Submit your next manuscript to BioMed Central
and take full advantage of:

- Convenient online submission
- Thorough peer review
- No space constraints or color figure charges
- Immediate publication on acceptance
- Inclusion in PubMed, CAS, Scopus and Google Scholar
- Research which is freely available for redistribution

Submit your manuscript at
