HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
CHANGES IN EMOTIONAL AND BEHAVIOR PROBLEMS, AND BRAIN MORPHOMETRY FOLLOWING MILD TRAUMATIC BRAIN INJURY IN EARLY ADOLESCENCE: A PRE-POST STUDY DESIGN

INTRODUCTION

Mild traumatic brain injury (mTBI)
- highly prevalent in children
- emotional & behavioral difficulties [1]

Interaction btw injury physiopathology & brain maturation may underpin long-term difficulties following mTBI [2]

Very few neuroimaging studies - conflicting results [2]
- ↓ gray matter volumes and cortical thickness following pediatric mTBI
- no changes

Unsolved question: differences already existed before the injury ?
- Adolescent Brain Cognitive Development (ABCD) [3] - rare opportunity to explore it

OBJECTIVE

To examine longitudinal changes in emotional and behavior problems, and brain morphometry in young adolescents with and without mTBI using a pre-post study design

CONCLUSION

As compared to non-injured peers, children with mTBI show no different profiles in emotional and behavior problems, but greater global brain volume and cortical thickness at baseline. Further exploration is needed to fully understand these findings.

MEASURES

ABCD dataset
- Release 4.0
- Baseline & 2-year follow-up

Parent’s retrospective report of mTBI
- Parent Ohio State Traumatic Brain Injury Screen-Short Modified [4, 5]

Emotional and behavioral problems

Volume and Cortical thickness
- Pre-processed and quality checked T1-w MRI data (FreeSurfer 5.3) [7]
- Right & left hemisphere total volumes and mean cortical thickness in Desikan atlas [8]
- Scanner effects (n = 24) corrected before statistical analyses - longitudinal ComBat [9]

STATISTICAL ANALYSES

Longitudinal changes modeling
- Two-group Latent Change Score Model [10]

RESULTS

Emotional and behavioral problems

Total volumes

Mean cortical thickness

Participants

ABCD Dataset Release 4.0 (N = 11,876)
- TBI before the study N = 457
- Head or neck injury N = 2,621
- No TBI information N = 1,440

Eligible participants (N = 7,354)
- No imaging data N = 80
- Insufficient T1w quality N = 15
- Imbalanced scanner N = 324
- Missing predictors N = 10

Final sample (N = 6,925)
- Controls (N = 6,780) 3,309 [49%] 10 ± 0.6 years
- mTBI* (N = 145) 86 [59%] 10 ± 0.6 years
  *mTBI with loss of consciousness ≤30 min or memory loss
