HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

The value of multidisciplinary team meetings (MDTm) in the diagnosis and management of childhood interstitial lung disease (chILD) among the RespiRare network

BACKGROUND

- Epidemiological data are limited
- Childhood interstitial lung disease (chILD) is most likely under-diagnosed
- The development of expertise networks and national or international databases are crucial to increase knowledge in chILD
- The multidisciplinary team meetings (MDTm) are essential tools to increase diagnostic yield and management

OBJECTIVES

- TO STUDY THE VALUE OF MDTm IN THE DIAGNOSIS AND MANAGEMENT OF chILD
- TO EVALUATE THE IMPACT OF MDTm FOR THE USERS

PATIENTS/METHODS

MDTm were set up by the RespiFIL network in 2018

- How: Each month, by video conference, enabling screen and data sharing
- Who: A quorum, pediatric pulmonologists, radiologists, geneticists, and pulmonologists, with an average of 10.5 participants per meeting

To evaluate the usefulness of the MDTm and the satisfaction of the participants, a survey was sent by email at least 3 months after the MDTm to the participants

CONCLUSION

- MDTm meet a general need for clinicians to be supported in their diagnostic work-up and management, particularly in areas where there are fewer professionals with expertise in rare respiratory diseases
- CHILD's MDTm allow to share knowledge and develop promising research projects

RESULTS

Between April 2018 and December 2022, 216 patients were discussed

- 178 patients from 36 RespiRare centers
- 38 patients from other countries
- 116 boys / 100 girls
- 142 were under 2 years of age

Before MDTm, the thoracic CT-scan was the most frequently performed.

Genetic analysis was widely performed (71% patients), while only 19% of children had a lung biopsy.

The MDTm allowed

- A correction of the chILD diagnosis in 25 % patients (Figure 1)
- To exclude chILD in 7% patients
- A treatment modification for 99 (46%) children (increase in the treatments number or dosage for 78 (36%) children, decrease for 18 (8%) children and modification in 16 (7%) children.

Figure 1. Comparison of the chILD diagnoses before and after MDTm

Satisfaction of the users

- A total of 32 answers to the survey were obtained
- Mains benefits identified : assistance with therapeutic management (75%) and diagnosis (68.8%), increasing the knowledge (43.8%)
- Participants rated, from 1 to 10. A score > 7/10 was obtained in 73.8% and a score <5/10 was obtained in only 6.2% of cases
